CLOSETMUSE

AI-POWERED VISUAL SMART WARDROBE ASSISTANT

PROBLEM

People often own many clothing items but still spend time deciding what to wear. Wardrobe choices are scattered across physical storage, and users may struggle to remember what they own or combine items for a specific preference or occasion.

OUR SOLUTION

ClosetMuse turns a user's own clothing photos into a visual digital wardrobe. AI analyses each uploaded item and identifies useful attributes such as category, colour, pattern and style. Users can then request outfit ideas in text or by uploading a short voice recording. The system transcribes the request and uses it together with the actual wardrobe images to generate outfit combinations.

PROTOTYPE WORKFLOW

01 ADD CLOTHES	02 ANALYSE	03 ASK BY VOICE	04 GET OUTFITS
Upload personal clothing photos	Recognise clothing attributes	Convert speech into text	Generate combinations from wardrobe

TECHNOLOGY

Gemini multimodal AI is used for visual clothing analysis and outfit generation. Gnani AI Prisma speech-to-text converts the uploaded voice request into text. React, TypeScript and Vite power the interface; Supabase provides authentication, database and private image storage, with Edge Functions handling AI requests securely.

WHAT MAKES IT USEFUL

Recommendations are grounded in the user's existing wardrobe rather than a catalogue of products. A voice request lets users express what they want naturally, while visual analysis helps the application work with the clothes they have uploaded. The current build is a working prototype demonstrating this end-to-end flow.
